---

When solar projects reach the end of their expected performance period, there are several management options. They include extending the performance period through reuse, refurbishment, or repowering ...

The reuse and repair for reuse of PV modules and system components might be limited for use in new systems by state and local interconnection, fire, building, electric, and equipment ...

Due to normal wear and tear, new software, or engineering innovations, it can be necessary to replace components on a solar or wind energy system prior to the end of its lifespan. When a solar or wind ...

This marketplace allows decommissioned materials to be reused in the form of discounted, warrantied solar project components from reputable sources. This gives new life to old materials while reducing ...

Solar panels contain several valuable and recyclable materials that can be recovered at the end of their lifecycle. Glass constitutes approximately 75% of a typical silicon-based panel and can ...

Decommissioning refers to removal of equipment and restoration of the site. Unlike some other forms of development, a decommissioned solar project site can be repurposed for other uses, such as ...

When the cleanup is done, the land can be used for agriculture, if that was its previous use, or it can host some other development, including a new solar farm.

When the cleanup is done, the land can be used for agriculture, if that was its previous use, or it can host some other development, including a ...

When solar panels, which typically have a lifespan of more than 25 years, reach the end of their lives and become a waste stream, they must be managed safely. Find information here about ...

## Can the remaining components of the solar project be used

Repowered solar energy systems may provide increased production and sales tax revenue (in states where energy system components are not exempt from sales tax) as (a) solar system parts are ...

For a solar project, components can be considered functionally interdependent if they can generate electricity independently from the rest of the project and can be separately metered.
