What are photovoltaic (PV) cells?

Photovoltaic (PV) cells, commonly known as solar cells, are the building blocks of solar panels that convert sunlight directly into electricity. Understanding the construction and working principles of PV cells is essential for appreciating how solar energy systems harness renewable energy.

What is a solar cell & a photovoltaic cell?

**Solar Cell Definition:** A solar cell (also known as a photovoltaic cell) is an electrical device that transforms light energy directly into electrical energy using the photovoltaic effect.

Why are silicon-based solar cells used in photovoltaic (PV) industry?

(a) working principle of solar cell with p-n junction structure and (b) loss mechanism in standard p-n junction solar cells. Over the past few decades, silicon-based solar cells have been used in the photovoltaic (PV) industry because of the abundance of silicon material and the mature fabrication process.

What is the working principle of solar cells?

Chapter 4. The working principle of all today solar cells is essentially the same. It is based on the photovoltaic effect. In general, the photovoltaic effect means the generation of a potential difference at the junction of two different materials in response to visible or other radiation. The basic processes behind the photovoltaic effect are:
